First Octet

```
First Octet {
    Config Rotation (2),
    CID Len or Random Bits (6),
}
```

4 codepoints:
1 reserved for unroutable CIDs
3 for config (key) rotation

0	1
1	2
2	0 (new)

1   2

Config can roll out in any order, as long as everyone gets it before the next one begins

The Change (PR [#216](#))

```
First Octet {                   3
    Config Rotation (2),        5
    CID Len or Random Bits (3),
}
```

Why?

People who actually run big deployments say they can't guarantee everyone gets the config before the next one rolls out

Why Not? Two (very minor) problems

- Length self-encoding limited to 32 bytes, not 64
- An attractive nuisance

Why Not? Two minor problems

- Length self-encoding limited to 32 bytes, not 64
- An attractive nuisance
